

ABSTRACT OF THE DISCLOSURE

A method of making a mask slipper, comprising the steps of forming a mask from a material selected from the group consisting of plastic, latex and fabric; forming a composite sole member having a first layer of inner filler material; forming a composite upper member having a second layer of inner filler material, an outer surface for receiving the mask, and an inner surface for receiving an inner lining. The method of making the mask slipper further composes the steps of attaching said mask to said outer surface of the composite upper member; attaching the inner lining to the inner surface of the composite upper member; attaching the composite sole member to the composite upper member to form the mask slipper; and turning of the mask slipper such that a correct outer side is on the outside of the formed mask slipper.
